

# Classification Schemes of Information Science: Twenty-Eight Scholars Map the Field

**Chaim Zins**

*Knowledge Mapping Research, 26 Hahaganah Street, Jerusalem 97852, Israel.*

*E-mail: chaim.zins@gmail.com*

**The field of Information Science is constantly changing. Therefore, information scientists are required to regularly review—and if necessary—redefine its fundamental building blocks. This article is one of a group of four articles, which resulted from a Critical Delphi study conducted in 2003–2005 (Zins, 2007a, 2007b, 2007c). The study, “Knowledge Map of Information Science,” was aimed at exploring the foundations of information science. The international panel was composed of 57 leading scholars from 16 countries who represent nearly all the major subfields and important aspects of the field. This particular article documents 28 classification schemes of Information Science that were compiled by leading scholars in the academic community. This unique collection of 28 classification schemes portrays and documents the profile of contemporary Information Science at the beginning of the 21st century.**

## Context

The field of Information Science (IS) is constantly changing. Therefore, information scientists are required to regularly review—and if necessary—redefine its fundamental building blocks. This article is part of a group of four articles, which resulted from a Critical Delphi study conducted in 2003–2005. The study, Knowledge Map of Information Science, explores the theoretical foundations of information science. It maps the conceptual approaches for defining data, information, and knowledge (Zins, 2007b), as well as the major conceptions of Information Science (Zins, 2007a). It portrays the profile of contemporary Information Science by documenting 28 classification schemes compiled by leading scholars over the course of the study, which are presented here; and culminates in developing a scientifically based and theoretically grounded knowledge map (Zins, 2007c).

Formulating a knowledge map—which is equivalent here to a subject classification scheme—means to set the boundaries of the field and define its main parts. This article is

focused on exploring how leading scholars and practitioners in the academic milieu map the field. This exploration is an important step on the road to understanding the essence of contemporary information science and to ground the mapping of the field on empirical data.

## Knowledge Mapping

Knowledge mapping plays an essential role in the construction, learning, and dissemination of knowledge (Zins, 2004). How do information scientists structure the field of Information Science? The literature provides thousands of knowledge maps; not all of them are comprehensive and systematic. In fact, most of them are partial, incomplete, and inconsistent. Knowledge maps of the field can be found in library classification schemes (e.g., Library of Congress Classification [LCC], Dewey Decimal Classification [DDC], and Universal Decimal Classification [UDC]), classification schemes in bibliographic resources, information services and databases (e.g., Information Science Abstract [ISA] and Library and Information Science Abstract [LISA]), thesauri (e.g., *ASIS Thesaurus of Information Science and Librarianship*; Milstead, 1998), conferences' programs (e.g., American Society for Information Science and Technology [ASIST] Annual Meeting), course syllabi, introductory texts, and encyclopedia entries. Nearly every book on information science explicitly or implicitly presents a knowledge map of the relevant body of knowledge in its table of contents.

Still the structuring has to be systematic. Formulating a systematic knowledge map should be based on a systematic conception of the field. Formulating a systematic conception of Information Science should be grounded on systematic conceptions of the constitutive concepts data, information, and knowledge (see Zins, 2007b). This article documents 28 classification schemes that portray the diversified aspects of the field. All of them are based on reflective thinking.

## Methodology

The scientific methodology is Critical Delphi. Critical Delphi is a qualitative research methodology aimed at facilitating critical and moderated discussions among experts

Received November 15, 2005; revised March 13, 2006; accepted March 13, 2006

© 2007 Wiley Periodicals, Inc. • Published online 6 February 2007 in Wiley InterScience (www.interscience.wiley.com). DOI: 10.1002/asi.20506

(the panel). The international and intercultural panel is composed of 57 participants from 16 countries. The panel is unique and exceptional; it is comprised of leading scholars who represent nearly all the major subfields and important aspects of the field (see Appendix A). The indirect discussions were anonymous and were conducted in three successive rounds of structured questionnaires. The first questionnaire contained 24 detailed and open-ended questions covering 16 pages. The second questionnaire contained 18 questions in 16 pages. The third questionnaire contained 13 questions in 28 pages (see relevant excerpts from the three questionnaires in Appendix B). The return rates were relatively high: 57 scholars (100%) returned the first round, 39 (68.4%) returned the second round, and 39 (68.4%) returned the third round. Forty-three panelists (75.4%) participated in two rounds (i.e., R1 and either R2 or R3), and 35 panelists (61.4%) participated in all three rounds. In addition, each participant received his or her responses that I initially intended to cite in future publications. The responses were sent to each panel member with relevant critical reflections. Forty-seven (82.4%) participants responded and approved their responses. Twenty-three of them, which is 48.9% (23 out of 47), and 40.3% of the entire panel (23 out of 57) revised their original responses. Therefore,

one can say that actually the critical process (the study) was composed of four rounds.

### *Formulating the Schemes*

To be specific, the process of formulating the schemes was exhaustive (see Appendix B). It consisted of three steps. First, in the second round each panel member was asked to compile a knowledge map of the field, or rather a classification scheme, which represented his or her conception of Information Science. Next, in the third round, the investigator presented the panel's schemes, and each participant was asked to comment on the various schemes, select the one that best represented his or her position, and revise the scheme that he or she had developed in the second round. Finally, the investigator sent personal letters to the authors of the schemes. Each letter included the panel's relevant reflections, and if applicable, critical comments. Once again, each author was asked to revise his or her scheme.

### *The Panel's Schemes*

Twenty-eight panel members contributed their schemes and reflections, which follow:

Aldo de Albuquerque Barreto

- 1. Information Production and Organization**
  - 1.1 Information Nature, qualities & value
  - 1.2 Production of stocks of information
  - 1.3 Information management & control
  - 1.4 Technologies & practices of information
- 2. Information Distribution**
  - 2.1 Users & information communities
  - 2.2 Communication of information
  - 2.3 Information sources
  - 2.4 Channels of information & its flow
- 3. Information consumption and use**
  - 3.1 Information availability & access
  - 3.2 Information Uses & Applications
  - 3.3 Cognition Aspects of Information
  - 3.4 Assimilation of information
  - 3.5 The production of knowledge
- 4. History, Philosophy, Legal, Ethics, and Ancillary Aspects of Information**
  - 4.1 Legal Structure of Information (e.g., Copyright)
  - 4.2 Ethics of Information
  - 4.3 Policy & Politics
  - 4.4 Globalization aspects
  - 4.5 History, Philosophy, Environment

*“Reflections. In my view, information science is a set of flows, processes and actions that starts in a generator’s (author’s) mind and ends in a space where users (receptors) appropriates that information to be knowledge. As it is a dynamic model I cannot see it in a static table where headers do not match the whole idea.” [1] (Aldo Barreto)*

|---|---|

*“Rationale. It’s interesting that no one has produced a faceted (analytico-synthetic) system, so I’ve provided the basis for one... The fundamental facets are People, Object of Study, Systems, Space, and Time. These are subdivided into sub-facets and foci at a general level. It would need further conceptual development for sub-facets and foci, and a synthetic notation that would allow both inter- and intra-facet synthesis. The Universal Decimal Classification has been chosen for subdividing Space and Time because it is more highly developed in those areas than other general systems. Like other faceted systems, it is hospitable by nature and therefore potentially comprehensive. It is adequate and systematic. It is based on the most recent theoretical research in classification. It allows complex statements to be made using inter- and intra-facet synthesis (e.g., “qualitative historical research on information organization in 19th century France compared to 14th century China” or “quantitative research on information practice by user groups in electronic systems for specific discipline areas”). [3] (Clare Beghtol.)*

  - 4.2 Readership Studies
  - 4.3 Scientific Communication
  - 4.4 Research Evaluation

***“Rationale and structure.*** *The scheme is divided into four sections:*

*1) Foundations. This section relates to Information Science as well as Library Science, since Information Science has its own foundations in the concept of “information” that needs reference to a cognitive system or a knowing subject. “Information” starts when signs are in connection with an interpreter. Similarly, Library Science relates to theories of mediating human knowledge and elaborating methodologies in order to connect external memories (books and documents) with human cognitive ability.*

*2) Knowledge Organization. This section is the core of the scheme. It has two subsections, without hierarchical structure. One subsection is concerned with theoretical foundations and methodological problems, the other subsection concerns the tools created in the field of Information and Library Science in order to organize the knowledge.*

*3) Measuring and Evaluation. This section accommodates the procedures elaborated to measure the realization and the use of bibliographical entities, electronic resources in the WEB, and to evaluate them.*

*4) Social aspects. This section is concerned with the social side of the Knowledge Organization: research strategies of the users, characteristics of the scientific communication, and so on.” [4] (Maria Teresa Biagetti)*

*“Rationale. The rationale of the model is based on three basic premises. First, all organisms are data, information, knowledge systems. They could not deal with the external world without them. Second, information is a state of consciousness (i.e., awareness). Thus, information is a cognitive/affective process and the products of that process (Miller, 1978). The focus is on the product and management of these processes (Drucker, 2001). Third, technology augments the human capacities and the products there from. (Englebart, 1962).*

*Based on these premises, ontology of human organisms can provide a map of the various relationships between an event (i.e., state of the world), the sensory mechanism that receive energy from the outside world, the movement (transmission) of these sensory impulses (transmission) to the brain (processors). The knowledge component of the augmented data information knowledge (ADIK) systems has reference to the formulation of judgment (i.e., decision/action) (Newell, 1972) that follows the processing of data-information. Decision incorporates an application of understanding, analysis, synthesis and evaluation (Bloom, 1956), the products of these processes are transferred (i.e., communicated) to others (e.g., cells, person, social entities) responding to various states of an event. The main role of the ADIK system is to respond to various states of the event world.*

*Information science establishes the law and principles that govern the relationships in the analysis, design, and evaluation of ADIK systems and wherein the basic premise, namely, such systems augment human processes, prevails (Debons et al., 1988).” [10] (Anthony Debons)*

**1. General**

Economics of information, Foundations of IS, History of IS, Information ethics, Information management, Information Quality Management, IS Education, IS Epistemology, Information systems, Information technology, Social, legal, & ethical aspects of information

**2. Information Generation Process**

Databases, Information Architecture, Information structures, Informetrics, Organization of Information, Philosophy of Information science, Thesauri,

**3. Information Processing, Storing & Communication Processes**

Abstracting, Artificial intelligence, Categorization & classification, Communication, Indexing, Information processing, Information storing, Taxonomies

**4. Information Use Process**

Bibliometrics, Cognition, Decision making, Information dissemination, Information retrieval, Information use & user, Knowledge management, Problem Solving, Social information/Social Informatics, Subject analysis, Webometrics

*“Rationale. The scheme represents the conception of information science as the science of information society (focusing on information systems); it studies the information and its five basic sub-processes – generation, processing, communication, storage and use - in order to optimize them. These processes are related to information as immaterial product and are representing the information cycle (within a research system). It is similar to the well known product cycle (within an economic system) with its three basic processes: production, distribution, and consumption. This is a managerial and pragmatic approach (Dragulanescu, 1999)” [11] (Nicolae Dragulanescu)*

**Actors**

People, institutions, professional organizations, research groups, funding agencies, and so on.

**Practices**

The activities that actors engage in when they use, categorize, mobilize, share, store, information

**Methods**

*The moments or strategies that actors use when they engage in the above practices (some of which are already known and well-understood in science and elsewhere, and others of which will arise through the emerging practices and technologies)*

**Technologies**

*The reified objects that actors utilize in carrying out their activities (including, but not limited to, digital hardware, computer software, and so on)*

*Inscriptions: all kinds of representations that mediate among actors – e.g., references, citations, digital libraries, web pages (and any similar medium that may emerge).*

*“Rationale. The rationale behind my proposal derives from the lessons learned in the last few decades by the students of science studies, especially what has come to be known as “actor-network theory.” Science, according to this view, is the outcome or performance of a heterogeneous set of actors, which are linked together in networks. A major premise of this view is that actors are not only human beings, but also non-humans such as, among others, technologies, documents, inscriptions, money, power, information, and so on. My separation of actors, inscriptions, and technologies in the following map should therefore be understood as a simplification.” [12] (Hamid Ekbia)*

[13] (Alan Gilchrist)

Information Phenomena at the various systems levels:

**1. Information at the quantum level**

Information processing subsystems: input transducer; internal transducer; channel and net; decoder; associator; memory; decider; encoder; output transducer

**2. Information at the cellular level**

Information processing subsystems: input transducer; internal transducer; channel & net; decoder; associator; memory; decider; encoder; output transducer

**3. Information at the organ level**

Information processing subsystems: input transducer; internal transducer; channel & net; decoder; associator; memory; decider; encoder; output transducer

**4. Information at the organism level**

Information processing subsystems: input transducer; internal transducer; channel & net; decoder; associator; memory; decider; encoder; output transducer

**5. Information at the group level**

Information processing subsystems: input transducer; internal transducer; channel & net; decoder; associator; memory; decider; encoder; output transducer

**6. Information at the organization level**

Information processing subsystems: input transducer; internal transducer; channel & net; decoder; associator; memory; decider; encoder; output transducer

**7. Information at the society level**

Information processing subsystems: input transducer; internal transducer; channel & net; decoder; associator; memory; decider; encoder; output transducer

**8. Information at the supra-national level**

Information processing subsystems: input transducer; internal transducer; channel & net; decoder; associator; memory; decider; encoder; output transducer

**9. Information at the cosmological level**

Information processing subsystems: input transducer; internal transducer; channel & net; decoder; associator; memory; decider; encoder; output transducer

*“Rationale and structure. The general systems levels and components stated above are adapted from J. G. Miller’s brilliant synthesis of general systems theory (1995), but with the addition of a quantum level and a cosmological level. Each level has an associated subsystem level that processes information (other complementary subsystems at the different levels process matter and energy). The information processing subsystems for each level are these: input transducer; internal transducer; channel and net; decoder; associator; memory; decider; encoder; output transducer.*

***Quantum level.** Information at the quantum level relates to the properties of very small, sub-atomic particles that function not according to most prevailing notions of classical physics (which are based on classical or Newtonian models of three dimensions of space and one of time), but according to n-dimensional models of space-time. Quantum models generally portray very small particles as having the capability of moving backward or forward through linear time, being in two positions simultaneously, and possibly traveling or communicating at super-luminous speed (faster than the speed of light). When quanta collectively form patterns, quantum coherence can occur and can stimulate such things as neural microtubule receptors, and thus neural functioning and cognition (See Penrose, 1994).”*

[14] (Glynn Harmon)

*“Reflections. It is almost impossible to elaborate an Information Science tree with clearly defined branches, because Information Science, as many others fields, does not have a tree structure, but rather a network structure. Therefore, dependencies and overlapping are an essential constituent of this multi-paradigmatic domain.” [24] (Maria Pinto)*

Cultural, social, ethical, legal, economic, methodological, political, philosophical, theoretical, & technological processes & aspects of:

**1. Education** for Library Information Science

**2. Metalibrarianship**

- 2.1 Foundations, History, Theory, Philosophy of:
- 2.2 Information Science
- 2.3 Knowledge
- 2.4 Librarianship
- 2.5 Library Science

**3. Human Aspects**

- 3.1 Cognition
- 3.2 Communication
- 3.3 Transfer
- 3.4 Education
- 3.5 Training
- 3.6 Uses
- 3.7 Behaviors

**4. Information**

- 4.1 Architecture & Design
- 4.2 Documentation & Publishing
- 4.3 Preservation & Archiving
- 4.4 Organization & Representation
- 4.5 Abstracting & Indexing
- 4.6 Categorization & classification
- 4.7 Storage & Retrieval
- 4.8 Management
- 4.9 Systems & Networks

**5. Knowledge**

- 5.1 Architecture & Design
- 5.2 Documentation & Publishing
- 5.3 Preservation & Archiving
- 5.4 Organization & Representation
- 5.5 Abstracting & Indexing
- 5.6 Categorization & classification
- 5.7 Storage & Retrieval
- 5.8 Management
- 5.9 Systems & Networks

**6. Research & evaluation**

- 6.1 Bibliometrics
- 6.2 Informatics
- 6.3 Informetrics

[27] (Joanne Twining)

Irene Wormell

**1. Information Analysis**

Quantitative analysis of information, Citation analysis, Informetrics, Bibliometrics, Webometrics, Subject & domain analysis, Publication analysis, Trend analysis, Innovation studies, (Databases), Diffusion studies, Information dissemination, Information manipulation, Research evaluation, Scientific Communication.

**2. Knowledge Organization**

Abstracting, Access systems, Categorization & classification, Classification schemes, Classification systems, Classification theory, Domain Analysis, Indexing, Knowledge representation, Knowledge structures, Information structures, Ontology, Organization of Information, , Subject analysis, Systems analysis, Taxonomies, Thesauri, Vocabulary control.

[28] (Irene Wormell)

## Discussion and Conclusion

### *Anthropological Document*

Twenty-eight scholars compiled classification schemes. This unique collection portrays and documents the profile of contemporary Information Science at the beginning of the 21st century.

*Delimitations.* It is expected that a systematic mapping should be adequate, comprehensive, and systematic (see Appendix B, Item 4 for definitions of the foregoing terms.). This means that it is assumed that each scheme should adequately and coherently represent the conception of the field, as it is understood by the contributor. Meaning, it is assumed that every one of the 28 schemes demonstrates a distinct conception of IS. For example, if one asserts that IS explores all the aspects of the data, information, knowledge, message (D-I-K-M) phenomena, I would expect his or her scheme to include all the aspects of the D-I-K-M phenomena. Each scheme should be up-to-date and comprehensive; that is, it should represent all the key characteristics of the field (at least in the eye of the contributor). Additionally, each scheme should be systematic; namely, all the categories at each level are mutually exclusive (i.e., without overlaps) and collectively exhaustive (i.e., cover all the various aspects of the field). Many of the 28 schemes are adequate, comprehensive, and systematic, and are based on solid theoretical and philosophical foundations. However, a few are incomplete, inconsistent, and logically faulty. For this reason, the study is focused on an overall analysis, rather than on evaluating the accuracy, adequacy, comprehensiveness, and coherency of the panel's diversified definitions.

*Types of classifications.* The collection is composed of different types of classification schemes. For the benefit of readers who are not familiar with the terminology, let us specify the various types. Note that the various types are not mutually exclusive. Most of the schemes are taxonomies; namely, they are grounded on empirical data (e.g., schemes [8], and [9]). A few are typologies; namely, they are based on conceptual analysis of the constitutive concepts (e.g., scheme [3], and [12]). Scheme [10] is a two-level hierarchical classification. The first level is a six-category typology. The second level of each category is taxonomy. Most of the schemes are subject classification schemes designed for practical purposes, for example, scheme [15] was designed by Donald Hawkins, the editor of *ISA*. A few classifications are "ontologies"; namely, they are meant to divide the relevant phenomenon into its key attributes, characteristics, or facets. Clare Beghtol's faceted classification (see scheme [3]) is an ontology.

*Six conceptions.* In a previous study, I (Zins, 2007a) formulated six conceptions, or models, of Information Science. These models were identified and formulated based on analysis of 50 definitions of Information Science. The six models are *the hi-tech model* (Information Science is the study of the mediating aspects of D-I-K-M phenomena as they

are implemented in the hi-tech domain.); *the technology model*, (Information Science is the study of the mediating aspects of D-I-K-M phenomena as they are implemented in the technological domain in general, namely, all types of technologies.); *the culture model* (Information Science is the study of the mediating aspects of D-I-K-M phenomena as they are implemented in the cultural domain.); *the human world model* (Information Science is the study of all the aspects of D-I-K-M phenomena as they are implemented in the human realm.); *the living world model* (Information Science is the study of all the aspects of D-I-K-M phenomena as they are implemented in the living world, human and nonhuman.); and *the living & physical worlds* (Information Science is the study of all the aspects of D-I-K-M phenomena as they are implemented in all types of biological organisms, human and nonhuman, and all types of physical objects).

*The mainstream information sciences.* The six models imply six different bodies of knowledge. Consequently, they establish six different fields of knowledge; all carry the same name, *Information Science*, and all are represented by the panel. However, the vast majority of the panel adopts the culture model. Evidently, the culture model represents the mainstream of contemporary Information Science.

This conclusion gets additional and unequivocal substantiation while analyzing the panel 28 classification scheme. Twenty-six schemes reflect the culture model. These are schemes [1], [2], [3], [4], [5], [6], [7], [8], [9], [10], [11], [12], [13], [15], [16], [17], [18], [19], [20], [21], [23], [24], [25], [26], [27], and [28]. One scheme, [14] represents the living & physical worlds model. One scheme, [22], is too general, and can represent any model.

*Knowledge Science.* I have suggested changing the name of the field from *Information Science* to *Knowledge Science* (Zins, 2006). This study substantiates the suggestion. More than 20 schemes include the concept "knowledge" as a main category or a subcategory of the field.

*Conclusions.* To summarize, based on the panel diversified schemes it is evident that the culture model represents the mainstream of contemporary Information Science, which means that Information Science is the study of the mediating aspects of D-I-K-M phenomena—*mutatis mutandis*—as they are implemented in the cultural (i.e., social) domain. Apparently, the suggestion to change the focus of the field—as well as its name—from information to knowledge is supported by a growing number of scholars.

### **A Concluding Remark**

This study documents 28 schemes of Information Science. This might help the reader to achieve better understanding of the issues and the considerations involved in establishing a solid, systematic, and comprehensive conception and knowledge map of the field; however, by no means does it replace the personal quest to ground one's positions on solid theoretical foundations.

## Acknowledgments

I would like to thank the Israel Science Foundation for a research grant that made the study possible (2003–2005). However, what made the difference were my 57 colleagues who participated in this exhausting and time-consuming study as panel members. Their invaluable contributions have made this study important, and I am truly grateful. Special thanks go to Prof. Anthony Debons and Prof. Glynn Harmon for their deep reflections throughout the study. The study was conducted at Bar-Ilan University in Israel.

## Appendix B

### *Excerpts From the Three Questionnaires on Developing Subject Classification Schemes*

Knowledge Map of Information Science:  
Issues, Principles, Implications  
(Second Round, April 15, 2004)

#### *2: Information Science Major Subfields and Key Concepts*

**Question 2.1** In this three-part assignment you will (a) list the most basic concepts, (b) list the major subfields, and (c) set a systematic classification of the field.

**A. List the (100) most basic IS concepts: Please check the following list (which was provided by the panel), erase duplications, add missing concepts, and if necessary rephrase the terminology. The list must be coherent with your conception of IS. Thanks. Your list:**

Abstracting, Access systems, Archival science, Artificial intelligence, Aviation informatics, Bibliometrics, Categorization and classification, Chemical documentation, Classification schemes, Classification systems, Classification theory, Cognition, Communication, Community informatics, Competitive intelligence, Computer-mediated communication, Copyright, Databases, Diffusion studies, Digital libraries, Digital preservation, Digital security, Distributed networked environments, Document delivery systems, Domain analysis, Economics of information, Education and training, Educational information, Electronic information industry, E-journals, E-learning, Evaluation, Evaluation of information systems, Foundations of information science, Health/biomedical informatics, High-density book storage systems, History of information science, Human information behavior, Indexing, Information architecture, Information dissemination, Information ethics, Information industry, Information management, Information manipulation, Information need, Information processing, Information quality evaluation, Information retrieval, Information science education, Information science Epistemology, Information storing, Information structures, Information technology, Information theory, Information use and user, Informetrics, Internet, Knowledge management, Knowledge organization, Knowledge representation, Knowledge structures librarianship, Library science, Labor in information systems, Management, Memetics, Message theory, Metadata, Metalibrarianship, Music information retrieval, Online searching, Ontology, Operations research, Organization of information, Philosophy of computation, Philosophy of information, Philosophy of information science, Philosophy of librarianship, Public information policies, Publishing, readership studies, Research evaluation, Scientific communication, Semiotics, Social information/social Informatics, Information in traditional and transitional societies (division by culture, e.g., Africa), Social, legal, and ethical aspects of information, Subject analysis, Systems analysis, Taxonomies, Technological information, Thesauri, User, Vocabulary control, Web, Webometrics.

**B. List the major subfields of IS: Copy your answer to A, erase duplications, add missing subfields, and if necessary rephrase the terminology. The list must be coherent with your conception of IS. [Note that if you prefer, you can skip B and move directly from A to C.] Your list:**

**C. Organize the major subfields of IS in a systematic order. Please copy your answer to B, erase duplications, add missing subfields, and rephrase the terminology (if necessary). Note that the result must be coherent with your conception of IS. Thanks. Your systematic list:**

Knowledge Map of Information Science: Issues, Principles, Implications  
(Third Round, October 8, 2004)

#### *4: Classification Schemes of Information Science*

**Requirements.** Each scheme is required to meet the following necessary requirements:

- (1) **Adequacy.** Each scheme should adequately and coherently represent the conception of the field, as it is understood by the contributor. It is assumed that every one of the 29 schemes demonstrates a distinct conception of IS. For example, if you claim that IS explores **all** the aspects of D, I, K, or M, I would expect your scheme to include **all** the aspects of D, I, K, or M.
- (2) **Comprehensiveness.** Each scheme should be up-to-date and comprehensive, that is, represent all the key characteristics of the field (at least in the eye of the contributor).
- (3) **Systematic.** Each scheme should be systematic; that is, all the categories at each level are mutually exclusive (i.e., without overlaps) and collectively exhaustive (i.e., cover all the various aspects of the field).

#### **Question 4.1**

1. Please revise your **preferred** scheme or formulate a **new** scheme. Please make sure that your scheme (a) adequately represents your conception of the field, (b) is comprehensive, and (c) is systematic. Thanks.
2. Please explain the rationale of your scheme. Thanks.

#### **Answer 4.1**

1. Copy your revised/new classification scheme here:
2. Formulate the rationale here:

**Question 4.2** If you have any comment or critical reflections, please let me know.

Note that I will send you (upon request) the panel's feedback regarding your scheme, so you will be able to revise it before the final report. Thanks.

|--|--|

**Researcher’s comments:** The author of the scheme noted that this is a thesaurus rather than a classification scheme. We are looking forward to see how you will turn your thesaurus into a classification scheme. Please elaborate section 7 (Philosophy). Thanks.

<sup>1</sup>The scheme was compiled by Richard Smiraglia, who replaced it with scheme [25] above.

## Scheme 11<sup>2</sup>

1. **Information and knowledge representation and organization systems and theory**  
including categorization and classification systems, thesauri, subject analysis and vocabulary control, abstracting and indexing, knowledge structures and representation, metadata, etc
2. **Evaluation methods and theories**  
including evaluation of information systems, of research, of access systems, in general and of all subcategories etc.
3. **Foundations of knowledge and information science**  
including history, philosophy, theory, epistemology, in general and of all subcategories, etc.
4. **Human information and knowledge behavior and theory**  
including communication, creation, dissemination, management, manipulation, research, search and retrieval, use, users, etc
5. **Information and knowledge professions and theory**  
Including archival science, library science, etc.
6. **Social, legal and ethical theory and practices of all of the above**

## Scheme 12<sup>3</sup>

Information Phenomena at the various systems levels:

1. **Cellular level**, e.g., Bioinformatics
2. **Organ level** e.g., medical or nursing informatics
3. **Organism level** e.g., cognitive science, biodiversity informatics, individual users
4. **Group level** e.g., social informatics
5. **Organization level**, e.g., management information systems
6. **Community level**, e.g., community health information systems (CHINs)
7. **Society level**, e.g., national defense information network
8. **Supranational level**, e.g., global news network
9. **Cosmological level**, e.g., NASA lunar information system

Each level would have associated input, internal processing, memory, output, etc.

**Researcher's comments:** An information system is a human artifact, which contains knowledge on the organism. What does information science explore? Is it the organism, or is it the human artifacts (i.e., the information system), which includes information on the organism? Logically, there are three options:

- (1) IS explores the object/organism. If this is the case, then "Information Science" is a generic name, which includes, for example, astronomy (at the cosmological level), and biology (at the cellular, organ, and organism levels).
  - (2) IS explores human artifacts (i.e., information systems). If this is the case, then "Information Science" is a generic name, which includes, for example, the *NASA lunar information system* (at the cosmological level), and Bioinformatics (at the cellular, organ, and organism levels).
  - (3) Information science explores both, the object/organism and the information system. If this is the case, than "Information Science" is a generic name, which includes biology as well as Bioinformatics and medical information.
- These are three different conceptions, which lead to three different information sciences. It seems that you follow the broadest (third) conception. If this is the case then you can further structure your scheme by dividing each level into two sub-categories: organism domain vs. information system domain.

<sup>2</sup>The scheme was compiled by Clare Beghtol, who replaced it with scheme [3] above.

<sup>3</sup>The scheme was compiled by Glynn Harmon, who replaced it with scheme [14] above.
